11.	Write a Program to Implement a Genetics algorithm using Python.	2081/05/28	
12.	Write a program to implement the A* Search Algorithm.	2081/05/28	
13.	Write a program to implement a greedy search algorithm.	2081/05/29	
14.	Write a program to implement the uniform cost search Algorithm.	2081/05/29	
15	Artificial Intelligence lab using Prolog	2081/05/30	

1. Write a Program to Implement Breadth-First Search using Python.

Source Code:

```
from collections import defaultdict

class Graph:
    # Constructor
    def __init__(self):
        self.graph = defaultdict(list)

    # Function to add an edge to the graph
    def addEdge(self, u, v):
        self.graph[u].append(v)

    # Function to perform BFS
    def BFS(self, s):
        # Mark all vertices as not visited
        visited = [False] * (max(self.graph) + 1)

        # Create a queue for BFS
        queue = []

        # Mark the source node as visited and enqueue it
        queue.append(s)
        visited[s] = True

        while queue:
            # Dequeue a vertex from the queue and print it
            s = queue.pop(0)
            print(s, end=" ")

            # Get all adjacent vertices of the dequeued vertex s
            # If an adjacent vertex has not been visited, mark it visited and enqueue it
            for i in self.graph[s]:
                if not visited[i]:
                    queue.append(i)
                    visited[i] = True

# Create a graph and add edges
g = Graph()
g.addEdge(0, 1)
g.addEdge(0, 2)
g.addEdge(1, 2)
g.addEdge(2, 0)
g.addEdge(2, 3)
g.addEdge(3, 3)

print("Following is Breadth-First Traversal (starting from vertex 2):")
g.BFS(2)
```

Output:

```
PS D:\Arjun Mijar (160)> py .\breadthFirstSearch.py
Following is Breadth-First Traversal (starting from vertex 2):
2 0 3 1
```

2. Write a Program to Implement Depth First Search using Python.**Source Code:**

```
from collections import defaultdict

# This class represents a directed graph using adjacency list representation
class Graph:
    # Constructor
    def __init__(self):
        # Default dictionary to store the graph
        self.graph = defaultdict(list)

    # Function to add an edge to the graph
    def addEdge(self, u, v):
        self.graph[u].append(v)

    # A function used by DFS
    def DFSUtil(self, v, visited):
        # Mark the current node as visited and print it
        visited.add(v)
        print(v, end=' ')
        # Recur for all the vertices adjacent to this vertex
        for neighbour in self.graph[v]:
            if neighbour not in visited:
                self.DFSUtil(neighbour, visited)

    # The function to do DFS traversal. It uses recursive DFSUtil()
    def DFS(self, v):
        # Create a set to store visited vertices
        visited = set()

        # Call the recursive helper function to print DFS traversal
        self.DFSUtil(v, visited)

# Driver code
g = Graph()
g.addEdge(0, 1)
```

```

g.addEdge(0, 2)
g.addEdge(1, 2)
g.addEdge(2, 0)
g.addEdge(2, 3)
g.addEdge(3, 3)

print("Following is DFS from (starting from vertex 2):")
g.DFS(2)

```

Output:

```

PS D:\Arjun Mijar (160)> py .\depthFirstSearch.py
Following is DFS from (starting from vertex 2):
2 0 1 3

```

3. Write a Program to Implement Tic-Tac-Toe game using Python.**Source Code:**

```
# Tic-Tac-Toe Program using random numbers in Python
```

```
# Importing all necessary libraries
import numpy as np
import random
from time import sleep
```

```
# Creates an empty board
def create_board():
    return np.array([[0, 0, 0],
                   [0, 0, 0],
                   [0, 0, 0]])
```

```
# Check for empty places on the board
def possibilities(board):
    l = []
    for i in range(len(board)):
        for j in range(len(board)):
            if board[i][j] == 0:
                l.append((i, j))
    return l
```

```
# Select a random place for the player
def random_place(board, player):
    selection = possibilities(board)
    current_loc = random.choice(selection)
```

```
board[current_loc] = player
return board

# Checks whether the player has three of their marks in a horizontal row
def row_win(board, player):
    for x in range(len(board)):
        win = True
        for y in range(len(board)):
            if board[x, y] != player:
                win = False
                break
        if win:
            return win
    return False

# Checks whether the player has three of their marks in a vertical row

        for player in [1, 2]:
            board = random_place(board, player)
            print(f"Board after {counter} move:")
            print(board)
            sleep(2)
            counter += 1
            winner = evaluate(board)
            if winner != 0:
                break
    return winner

# Driver Code
print("Winner is: " + str(play_game()))

```

Output:

```

PS D:\Arjun Mijar (160)> py .\ticTacToeGame.py
[[0 0 0]
 [0 0 0]
 [0 0 0]]
Board after 1 move:
[[0 1 0]
 [0 0 0]
 [0 0 0]]
Board after 2 move:
[[0 1 0]
 [2 0 0]
 [0 0 0]]
Board after 3 move:
[[0 1 0]
 [2 1 0]
 [0 0 0]]
Board after 4 move:
[[0 1 0]
 [2 1 0]
 [2 0 0]]
Board after 5 move:
[[0 1 0]
 [2 1 0]
 [2 1 0]]
Winner is: 1

```

4. Write a Program to Implement the Water-Jug problem using Python.

Source Code:

```

from collections import defaultdict

# Jug capacities and the target amount
jug1, jug2, aim = 4, 3, 2

# Initialize dictionary with default value as False to track visited states
visited = defaultdict(lambda: False)

# Recursive function to solve the water jug problem
def waterJugSolver(amt1, amt2):
    # If we reach the goal, print the solution and return True
    if (amt1 == aim and amt2 == 0) or (amt2 == aim and amt1 == 0):
        print(amt1, amt2)
        return True

    # If this state has already been visited, skip to avoid infinite recursion
    if visited[(amt1, amt2)] == False:
        # Print the current state
        print(amt1, amt2)

        # Mark the current state as visited
        visited[(amt1, amt2)] = True

        # Explore all possible moves:
        return (waterJugSolver(0, amt2) or          # Empty jug1
                waterJugSolver(amt1, 0) or          # Empty jug2
                waterJugSolver(jug1, amt2) or      # Fill jug1
                waterJugSolver(amt1, jug2) or      # Fill jug2
                waterJugSolver(amt1 + min(amt2, jug1 - amt1), amt2 - min(amt2, jug1 - amt1)) or # Pour jug2 into jug1
                waterJugSolver(amt1 - min(amt1, jug2 - amt2), amt2 + min(amt1, jug2 - amt2))) # Pour jug1 into jug2

    # Return False if no solution is found
    else:
        return False

# Driver code
print("Steps: ")
waterJugSolver(0, 0)

```

Output:

```
PS D:\Arjun Mijar (160)> py .\waterJugProblem.py
Steps:
0 0
4 0
4 3
0 3
3 0
3 3
4 2
0 2
```

5. Write a Program to Implement a Travelling Salesman Problem using Python**Source Code:**

```
from sys import maxsize
from itertools import permutations

# Number of vertices in the graph (cities)
V = 4

# Implementation of the Travelling Salesman Problem
def travellingSalesmanProblem(graph, s):
    # Store all vertices except the source vertex
    vertex = []
    for i in range(V):
        if i != s:
            vertex.append(i)

    # Store the minimum weight of the Hamiltonian Cycle
    min_path = maxsize

    # Generate all permutations of the vertices (except the start vertex)
    next_permutation = permutations(vertex)

    # Check each permutation
    for i in next_permutation:
        # Store current path weight (cost)
        current_pathweight = 0

        # Compute the current path weight
        k = s
        for j in i:
```

```
    current_pathweight += graph[k][j]
    k = j

# Add the cost to return to the starting point
current_pathweight += graph[k][s]

# Update the minimum path cost
min_path = min(min_path, current_pathweight)

return min_path

# Driver Code
if __name__ == "__main__":
    # Matrix representation of the graph
    graph = [[0, 10, 15, 20],
              [10, 0, 35, 25],
              [15, 35, 0, 30],
              [20, 25, 30, 0]]

    # Starting vertex (source city)
    s = 0

    # Output the minimum path cost
    print("Minimum path cost:", travellingSalesmanProblem(graph, s))
```

Output:

```
PS D:\Arjun Mijar (160)> py .\travelSalesManProblem.py
Minimum path cost: 80
```

6. Write a Program to Implement the Tower of Hanoi using Python.

Source Code:

```
# Recursive Python function to solve Tower of Hanoi
def TowerOfHanoi(n, from_rod, to_rod, aux_rod):
    if n == 1:
        print("Move disk 1 from rod", from_rod, "to rod", to_rod)
        return

    # Move n-1 disks from the source to auxiliary rod
    TowerOfHanoi(n-1, from_rod, aux_rod, to_rod)

    # Move nth disk from source to destination rod
    print("Move disk", n, "from rod", from_rod, "to rod", to_rod)

    # Move the n-1 disks from auxiliary rod to destination rod
    TowerOfHanoi(n-1, aux_rod, to_rod, from_rod)

# Driver code
n = 3 # Number of disks
TowerOfHanoi(n, 'A', 'C', 'B') # A, C, B are the names of the rods
```

Output:

```
PS D:\Arjun Mijar (160)> py .\towerOfHonai.py
Move disk 1 from rod A to rod C
Move disk 2 from rod A to rod B
Move disk 1 from rod C to rod B
Move disk 3 from rod A to rod C
Move disk 1 from rod B to rod A
Move disk 2 from rod B to rod C
Move disk 1 from rod A to rod C
```

7. Write a Program to Implement the Monkey Banana Problem using Python.

Source Code:

```
from poodle import Object, schedule
from typing import Set

class Position(Object):
    def __str__(self):
        if not hasattr(self, "locname"):
            return "unknown"
        return self.locname

    ])

    # Predict the class labels
    predictions = nb.predict(X_test)
    print("Predictions:", predictions)
```

Output:

```
PS D:\Arjun Mijar (160)> py .\naiveBayes.py
Predictions: [1 0]
```

10. Write a Program to Implement a Back-propagation Algorithm using Python

Source Code:

```

import numpy as np

# Define activation functions and their derivatives
def sigmoid(x):
    return 1 / (1 + np.exp(-x))

def sigmoid_derivative(x):
    return x * (1 - x)

# Define the neural network class
class NeuralNetwork:
    def __init__(self, input_size, hidden_size, output_size):
        # Initialize weights
        self.input_size = input_size
        self.hidden_size = hidden_size
        self.output_size = output_size

        self.weights_input_hidden = np.random.rand(self.input_size, self.hidden_size)
        self.weights_hidden_output = np.random.rand(self.hidden_size, self.output_size)

        self.bias_hidden = np.random.rand(self.hidden_size)
        self.bias_output = np.random.rand(self.output_size)

    def forward(self, X):
        # Forward pass
        self.hidden_layer_input = np.dot(X, self.weights_input_hidden) + self.bias_hidden
        self.hidden_layer_output = sigmoid(self.hidden_layer_input)
        self.output_layer_input = np.dot(self.hidden_layer_output, self.weights_hidden_output) +
        self.bias_output
        self.output = sigmoid(self.output_layer_input)
        return self.output

    def backward(self, X, y, learning_rate):
        # Backward pass
        output_error = y - self.output
        output_delta = output_error * sigmoid_derivative(self.output)

        hidden_error = np.dot(output_delta, self.weights_hidden_output.T)
        hidden_delta = hidden_error * sigmoid_derivative(self.hidden_layer_output)

        # Update weights and biases
        self.weights_input_hidden += np.dot(X.T, hidden_delta) * learning_rate
        self.weights_hidden_output += np.dot(self.hidden_layer_output.T, output_delta) * learning_rate

        self.bias_hidden += np.sum(hidden_delta, axis=0) * learning_rate
        self.bias_output += np.sum(output_delta, axis=0) * learning_rate

    def train(self, X, y, epochs, learning_rate):
        for epoch in range(epochs):
            output = self.forward(X)

```

```

    self.backward(X, y, learning_rate)
    if (epoch + 1) % 1000 == 0:
        loss = np.mean(np.square(y - output))
        print(f'Epoch {epoch + 1}, Loss: {loss}')
```

Example usage

```

if __name__ == "__main__":
    # Example data: XOR problem
    X_train = np.array([
        [0, 0],
        [0, 1],
        [1, 0],
        [1, 1]
    ])
    y_train = np.array([
        [0],
        [1],
        [1],
        [0]
    ])
```

Initialize and train the neural network

```

input_size = 2
hidden_size = 4
output_size = 1

nn = NeuralNetwork(input_size, hidden_size, output_size)
nn.train(X_train, y_train, epochs=10000, learning_rate=0.1)
```

Test the neural network

```

print("Predictions:")
for x in X_train:
    print(f'Input: {x}, Prediction: {nn.forward(x)}')
```

Output:

```

R = 8,
D = 7,
Y = 2

```

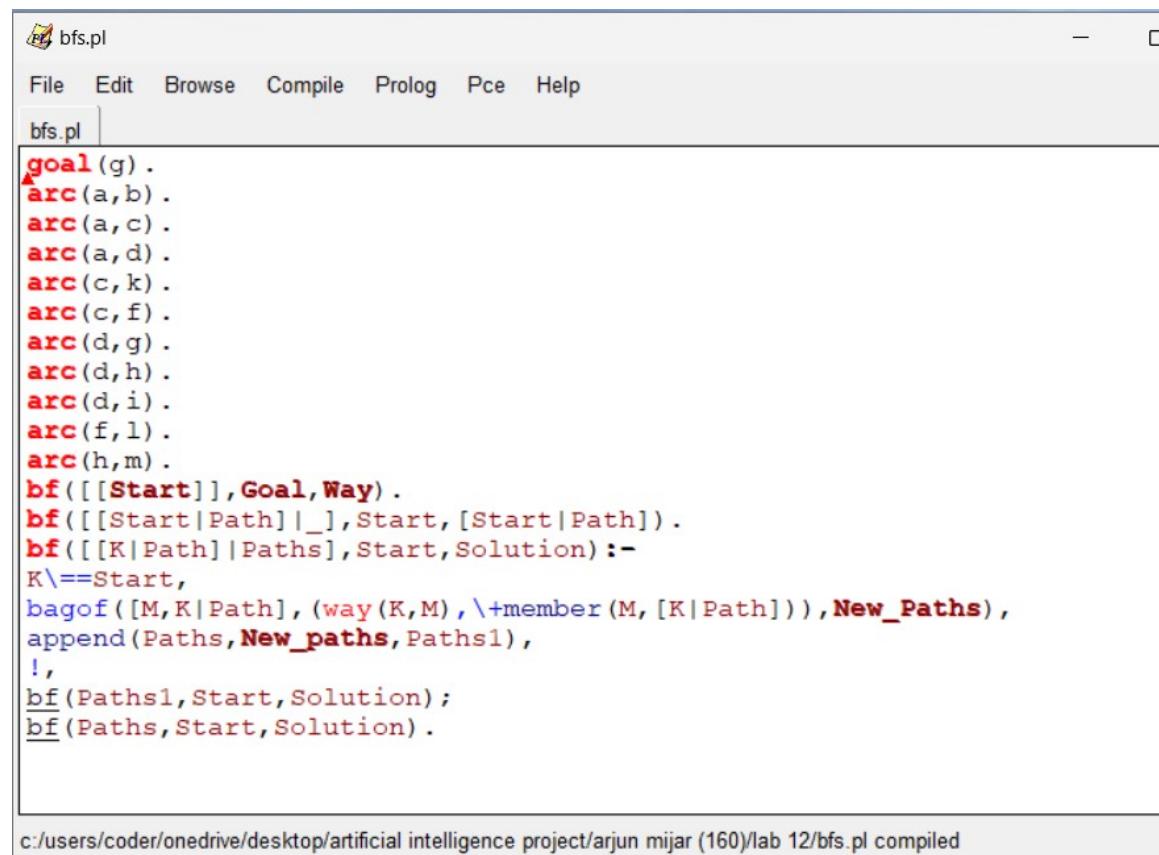

11b. Write a program to print a square of stars with a side length X.

The screenshot shows a Prolog IDE window titled "star.pl". The menu bar includes File, Edit, Browse, Compile, Prolog, Pce, and Help. The tab bar shows four files: 10.3.pl, greatest3.pl, crypt.pl, and star.pl, with star.pl currently selected. The main editor area contains the following Prolog code:

```
sqaure(1) :-  
    write('*****').  
  
square(X) :-  
    X >= 1,  
    write('*****'),  
    nl,  
    square(X-1).
```

The cursor is positioned at the end of the first line of the second clause. The status bar at the bottom displays the path "c:/users/coder/onedrive/desktop/artificial intelligence project/arjun mijar (160)/lab 11/star.pl compiled" and the line number "Line: 4".

12a. Write a program to find the path from the start node to the goal node using breadth-first search.

```
